

Back to science: a CUSTOMIZED medium knows your cells and processes best

Medium development is the core of our expertise

Experience and customer feedback have taught us over and over again that the key factor for an optimized process lies in the perfect balance of nutrients within a culture medium. Even the best media products on the market will not fulfill all requirements to bring out the full potential of your specific cells and processes. Therefore, let us take you back to the roots of a successful process: customized culture media and feeds.

Xell has been recognized for its customized cell culture medium development and media products for over a decade now. Custom medium development can be planned and managed according to your needs and timeline. With our long-standing experience we can support your processes using e.g. CHO, BHK, Hybridoma, HEK, and other human cell lines for:

- Protein production
- Vaccine production
- AAV production
- Lentivirus production
- Gene/Cell therapy applications

Let's talk about your process challenges and take advantage of a free feasibility study to evaluate the potential of a custom development now – [click here](#)
